

Trickle Vents

Welcome to your newly energy-efficient home! Here's some important information on the trickle vents for your windows.

What are Trickle Vents

These are small, controlled openings at the top of your window frames. They allow a small amount of fresh air to circulate continuously, without you having to open a window.

Why you should use Trickle Vents

These reduce excess moisture which is a main cause of condensation, mould, and poor air quality. They're especially important in energy-efficient homes, where insulation and new windows make spaces more airtight, so controlled airflow remains essential.

These measures are recommended under government energy efficiency guidance and they're there to ensure the improvements we install perform safely and effectively for the long term.
